C++ Programming - Advanced - Assignment

Author: Peter Tse (mcreng)

Introduction

In SmartCar image processing, you probably need to store the coordinates of certain points in the image. Here you are going to develop a coordinate class (`Coord`) for it. There is **NO** provided header.

Requirements

- Include the x and y coordinates with generic type, default is `uint16_t`
- Make the attributes x and y public
- Overload the following operators
  - `operator+`
  - `operator-`
  - `operator+=`
  - `operator-=`
  - `operator<<` of `ostream`
- Implement the following mathematical functions
  - Distance ($d = \sqrt{(\Delta x)^2 + (\Delta y)^2}$)
  - Manhattan Distance ($d = |\Delta x| + |\Delta y|$)
  - Slope ($m = \frac{\Delta y}{\Delta x}$)
  - Triangle Area enclosed by three points A, B, C ($a = \left|\frac{A_x(B_y - C_y) + B_x(C_y - A_y) + C_x(A_y - B_y)}{2}\right|$)
  - Radius of Circle generated by three points A, B, C ($r = \frac{AB \cdot BC \cdot CA}{4[ABC]}$, where $[ABC]$ is the triangle area of ABC)
- Bonus
  - Figure(Find) a less resource-intensive (in return of less accuracy) implementation of square root and use it in calculating distance.
  - Figure a way to convert one type of Coordinate class into another one with different type (such as `Coord<float>` to `Coord<int>` for example).

Google is your friend when it comes to problems that you encounter in C++ programming.

Submission

In this assignment, three aspects will be examined.

- Correctness

  The correctness of your implementations.

- Readability

  The readability of your codes, including the presence of documentations.

- Coding Practice

The coding style that you have, including OOP practices.

Try your best in achieving fully in all three aspects. Deadline of this assignment would be 30/12.

Similar to Assignment 2 (Address), open a **private** repository (name it `Internal-Assignment3`) and invite `mcreng` as a collaborator to submit your work.
